

Kevin Allan, SUNY Cortland student; Senate District 40, Assembly District 94

To start I believe this plan is one that's much needed and past due. Having a plan set out to keep legislators on track and for goals to be met is something that's heavily needed. I support the Climate Act's benefits being directed to disadvantaged communities. I could even see more of it being allocated to those communities, but I believe 35% is a good number to start at. The ten year plans make sense as the lowering of GHG emissions will have to coincide with the increased usage of electric renewable energy.

Now addressing the 10 key issues, I like the prohibition of new fossil fuel plants. It would be impossible for these to be completely shut down all at once and I think that's what those opposing the transition from fossil fuels are scared of. Similar to the fossil fuel infrastructure, it's smart for new buildings to be electric only. It wouldn't be possible for them to get rid of gas powered buildings that are already in place so making sure the new ones are electric powered is the best we can do in the long run. Next, I'm a big opponent of tax cuts for companies that clearly don't need it, especially companies that pollute and contribute to our climate issues. What I wish could be included is the way that this would be enforced. I think it's clear public funding shouldn't be going towards these big businesses but as taxpayers these words don't mean anything. I think it's ideally a good thing to strive for but how do we know this will be done when there has been no sign of it stopping. I like the idea of accountability when it comes to the climate report cards, as long as its easy for people to access and up to date. Any investment in the climate action plan is good to hear and I agree with the things listed. I fear when these plants are closed down they could be converted to crypto mining stations so I support that. I hope we increase education on "greenwashing" as energy corporations will use that to try to con people. Cutting down on solid waste is something that must be done as well. I don't know the solution since all products we usually purchase come in multiple packages.
